

Pizza42 + Auth0

Sales Engineer Presentation Talk Track Guide

This guide provides slide-by-slide speaking notes and presentation coaching for delivering the Pizza42 + Auth0 CIAM architecture presentation in a customer-facing Sales Engineering / Solutions Engineering setting.

Slide 1 — Title Slide

- Set the tone as a trusted advisor, not just a developer.
- Talk Track: 'Today I'll walk through how Pizza42 uses Auth0 to deliver a modern customer identity architecture balancing security, user experience, and scalability.'
- Emphasize that the project is about business outcomes as much as authentication.

Slide 2 — Business Goals

- Slow down on this slide — this is one of the most important slides in the deck.
- Security Goal: Offload credential management and reduce breach exposure.
- Product Goal: Deliver frictionless onboarding with social login and passkeys.
- Future Goal: Create a foundation for personalization and AI-driven experiences.

Slide 3 — High-Level Architecture

- Explain the trust boundaries clearly.
- The SPA delegates authentication entirely to Auth0.
- The backend independently validates every token.
- Privileged operations remain isolated behind server-side M2M credentials.

Slide 4 — Why Universal Login

- Frame Universal Login as both a security and business solution.
- Auth0 owns the authentication surface so Pizza42 never handles passwords.
- Built-in MFA, password reset, social login, and passkeys reduce engineering overhead.
- Key phrase: 'It's not just a login page — it's a security boundary.'

Slide 5 — OAuth 2.0 & OIDC Strategy

- This is your technical credibility slide.
- Explain why Authorization Code + PKCE is the correct modern approach for SPAs.
- Mention that Implicit Flow and ROPC were intentionally rejected due to security concerns.
- Tie the decision back to OAuth 2.1 best practices.

Slide 6 — End-to-End Token Flow

- Describe this slide as a chain of trust.
- Auth0 authenticates the user.
- The backend validates issuer, audience, signature, expiration, and scopes.
- The frontend is never treated as a trusted security boundary.

Slide 7 — Security Controls

- Group controls into layers rather than reading bullets one-by-one.
- Identity assurance through Universal Login.
- Cryptographic assurance through RS256 JWT validation.
- Authorization through scope enforcement.
- Operational security through isolated M2M credentials.

Slide 8 — Scopes vs RBAC

- Explain that scopes are ideal for lightweight authorization models.
- Mention that all customers currently share the same permission model.
- Show that the architecture is already designed to evolve toward RBAC.
- Position this as an enterprise scalability discussion.

Slide 9 — Business Value Mapping

- This is one of the strongest Sales Engineer slides in the deck.
- Security: reduce credential liability.
- Product: improve onboarding conversion through low-friction login.
- Marketing: progressive profiling enables richer customer insights.
- Operations: fewer password-reset support tickets.

Slide 10 — Production Roadmap

- Demonstrate awareness of the difference between PoC and enterprise production systems.
- The PoC optimizes for clarity.
- The roadmap optimizes for scale, resilience, and operational maturity.
- Discuss adaptive MFA, observability, refresh token rotation, and database migration.

Slide 11 — Demo Walkthrough

- Use this slide as a roadmap rather than reading it in detail.
- Transition into the live demo smoothly.
- Keep energy conversational and customer-facing.

Slide 12 — Key Takeaways

- Close with executive-level messaging.
- Modern identity architecture is about balancing security, UX, scalability, and operational simplicity.
- Reinforce that the architecture follows current CIAM best practices.

Slide 13 — Architecture Diagram

- Use this slide primarily during technical Q&A.;
- Be prepared to discuss PKCE, M2M isolation, scopes vs RBAC, and JWT validation.
- This is your backup architecture deep-dive slide.

Presentation Guidance:

- Speak like a trusted advisor, not just a developer.
- Use the structure: Business Problem → Technical Decision → Business Outcome.
- Be opinionated and explain why certain legacy approaches were intentionally rejected.
- Stay calm, structured, and consultative throughout the presentation.
