

Pizza42 + Auth0

Pre-Sales Presentation Talk Track Guide

This guide is designed to help walk through the Pizza42 + Auth0 presentation like a customer-facing Solutions Engineer. The goal is not to teach OAuth specifications — it is to explain architectural decisions, security outcomes, and business value confidently.

Slide 1 — Title Slide

Start confidently and establish the purpose of the conversation.

Suggested opening:

“Today I'll walk through how Pizza42 could modernize customer identity using Auth0. The goal wasn't simply implementing login — it was designing a scalable customer identity architecture that improves security, reduces operational burden, and creates a better customer experience.”

Presentation Tip: Keep this short. Establish confidence and set the tone.

Slide 2 — Business Goals

Frame the customer problems before discussing technology.

- Security wanted to eliminate password liability and reduce breach exposure.
- Product wanted frictionless onboarding with social login and passkeys.
- Marketing wanted richer customer identity data for personalization.
- Engineering needed scalable OAuth and OIDC aligned architecture.

Close with:

“These challenges are exactly where a CIAM platform like Auth0 becomes valuable.”

Presentation Tip: Focus on stakeholder priorities rather than implementation details.

Slide 3 — Why Auth0

Position Auth0 as a platform solution.

- Universal Login removes credential liability.
- Social login and passkeys improve onboarding.
- OAuth + JWT validation protect APIs.
- Actions and metadata support personalization and future AI initiatives.

Strong closing line:

“Identity becomes a platform decision — not simply a login feature.”

Presentation Tip: Sound consultative rather than instructional.

Slide 4 — High-Level Architecture

Walk left-to-right through the architecture.

- React SPA handles frontend experiences.
- Universal Login centralizes authentication.
- Auth0 issues tokens after authentication.
- Backend APIs validate JWTs independently.
- M2M applications isolate privileged backend operations.

Main message:

“The architecture separates authentication, authorization, and privileged operations into distinct trust boundaries.”

Presentation Tip: Focus on architecture flow and trust separation.

Slide 5 — Why Universal Login

Focus on operational simplicity and security outcomes.

- Pizza42 never directly handles passwords.
- Built-in MFA, passkeys, social login, and recovery reduce development effort.
- Centralized authentication improves security posture and accelerates rollout.

Closing thought:

“Universal Login becomes one of the biggest security and operational leverage points in the architecture.”

Presentation Tip: Keep this business-outcome oriented.

Slide 6 — Separating Identity Responsibilities

Explain why each Auth0 application exists.

- React SPA handles customer authentication using Authorization Code Flow + PKCE.
- Protected Backend API validates JWTs and scopes before protected operations.
- M2M Application isolates privileged Management API access server-side.

Key message:

“Each component follows the OAuth model most appropriate for its trust boundary.”

Presentation Tip: Slow down here. This is one of the strongest architecture slides.

Slide 7 — OAuth Flows We Selected

Present OAuth flows as intentional security decisions.

- Authorization Code + PKCE protects browser-based SPAs.
- Client Credentials secures backend-to-backend communication.
- Refresh Token Rotation maintains seamless long-lived sessions securely.

Then explain intentionally rejected flows:

- Implicit Flow = legacy browser security posture.
- ROPC = direct password handling by the application.
- Auth Code without PKCE = insecure for public clients.

Main takeaway:

“The flows were selected intentionally based on trust model and security posture.”

Presentation Tip: Do not turn this into an RFC lecture.

Slide 8 — Tokens Used in the Architecture

Explain that different tokens serve different responsibilities.

- ID Token = authenticated customer identity.
- Access Token = API authorization and scope enforcement.
- Refresh Token = long-lived sessions and silent renewal.

Main message:

“Separating token responsibilities improves scalability and security across the platform.”

Presentation Tip: Avoid deep JWT internals or cryptography details.

Slide 9 — Scopes vs RBAC

Explain lightweight authorization versus enterprise-scale authorization.

- Current POC uses direct scope enforcement for simplicity.
- Backend validates `create:orders` directly inside the Access Token.
- RBAC becomes valuable as organizational complexity scales.

Closing point:

“The architecture can evolve toward RBAC later without major frontend refactoring.”

Presentation Tip: This slide demonstrates scalability and future readiness.

Slide 10 — Security Controls

Frame this slide around defense-in-depth.

- JWT validation verifies tokens independently.
- Scope enforcement handles authorization.
- Email verification prevents unverified transactions.
- Secrets remain isolated server-side.
- Refresh rotation limits replay risk.
- Metadata remains protected from browser tampering.

Main takeaway:

“The platform does not rely on a single security control.”

Presentation Tip: Emphasize layered security rather than technical implementation.

Slide 11 — Business Value Mapping

Reconnect architecture back to business outcomes.

- Security reduces liability.

- Product improves onboarding and retention.
- Marketing gains richer identity data.
- Operations reduces support burden.
- Future AI initiatives gain structured customer identity context.

Strong closing:

“That’s why identity becomes a strategic platform investment.”

Presentation Tip: Keep this highly consultative and stakeholder-focused.

Slide 12 — Key Takeaways

Close at a strategic level.

- Modern OAuth and Auth0 best practices.
- Balance between UX and security.
- Enterprise scalability and RBAC evolution path.
- Alignment across security, product, marketing, and engineering teams.

Recommended closing statement:

“The result is a scalable CIAM architecture that balances security, customer experience, and operational simplicity through a single modern identity platform.”

Presentation Tip: Slow down and sound calm, strategic, and executive-oriented.
